BCSE302L - Database Systems

Project Report

Topic - DBMS Car Sales and Inventory Management

By:

Bhargav Sargunesan Venkatesh - 23BCE5111

1. Introduction & Project Goal

The Indian automobile market is vast, with information fragmented across numerous sources. This project's primary goal was to design and build a centralized Database Management System (DBMS) to solve this problem.

The application serves as a unified platform for both **Customers** and **Dealerships**.

- For customers, it provides a single portal to browse all available car models and variants, find real-time inventory at local dealerships, and book cars or test drives.
- For dealers, it provides a secure dashboard to manage their inventory, track sales, view upcoming test drives, and analyze their performance.

The system is built on a classic **3-Tier Architecture**, which separates the application into a Database, a Backend Server, and a Frontend Client.

2. Technology Stack

This project was built using a beginner-friendly, powerful, and lightweight technology stack, focusing on understanding the fundamentals of full-stack application development.

- **Database: SQLite**
 - A serverless, file-based SQL database. It's lightweight, fast, and requires zero configuration, making it perfect for managing our structured, relational data without the overhead of a large database server.
- **Backend: Node.js + Express.js**
 - Node.js allows us to use JavaScript on the server. The Express.js framework provides a minimal and flexible way to build a robust **REST API**. This "brain" connects to the database, executes logic, and serves data to any client that asks for it.
- **Frontend: HTML, Tailwind CSS, and "Vanilla" JavaScript**
 - This stack provides a direct, foundational understanding of web development.
 - **HTML:** Structures the entire application.
 - **Tailwind CSS:** A modern CSS framework for rapid, professional styling.
 - **Vanilla JS:** Used to create a dynamic Single-Page Application (SPA) experience, make API calls (fetch), and update the page without a full reload.
- **Visualization: Chart.js**
 - A simple and flexible JavaScript library used to render the graphs on the analytics dashboard, turning raw sales data from the database into insightful visualizations.

3. Core Application Features

The application is divided into two distinct portals based on a secure login system.

A. Role-Based Authentication

- A user provides an email and phone number.
- The backend checks these credentials against both the Customer and Dealer tables to determine their role.
- The frontend then dynamically loads the correct portal (Customer or Dealer) for that user.

B. Customer Portal

- **Book a Car:** A multi-step guided flow that allows the customer to:
 1. Select a Manufacturer.
 2. View and select a car model (with real images).
 3. Select a specific variant.
 4. See a list of real-time, "In Stock" inventory for that variant from all dealerships.
- **Streamlined Booking:** Once a car is selected, the app automatically fetches the logged-in customer's details and the car's pricing information. The user only needs to click one button to confirm the booking.
- **Book a Test Drive:** A separate form allows customers to select any Manufacturer, Model, and Variant, choose a local dealer, and book a test drive for a specific date and time.

C. Dealer Portal

This is the secure backend dashboard for dealership staff. It features four main tabs:

- **Inventory:** Displays a complete list of all vehicles (including In Stock and Booked) at the logged-in dealer's showroom.
- **Sales Records:** A list of all completed sales for that dealer, showing the car sold, the customer's name, and the final price.
- **Test Drives:** A schedule of all upcoming and completed test drives at that dealer's location.
- **Live Search:** A powerful search bar on the Inventory, Sales, and Test Drive tabs. This demonstrates the database's relational power by filtering results in real-time as the dealer types.

D. Data Analytics

- This tab in the Dealer Portal provides two key visualizations of the sales data:
 1. **Sales by Manufacturer:** A bar chart showing the total number of cars sold by each brand, clearly illustrating market leaders.
 2. **Sales by Body Type:** A pie chart showing the sales distribution across categories

like SUV, Sedan, and Hatchback.

4. System Architecture & Implementation

A. Database Implementation

The database consists of **8 core tables** (*Manufacturer, Car_Model, Car_Variant, Dealer, Inventory, Customer, Sale, Test_Drive*). The relationships are established using Primary Keys (e.g., dealer_id) and Foreign Keys (e.g., the Sale table links vin, customer_id, and dealer_id). This relational model ensures data integrity; for example, a car (VIN) can only be sold once, and a sale can only be made from actual, "In Stock" inventory.

B. Backend Implementation (server.js)

The backend exposes a **REST API** with over 15 endpoints.

- **Data Endpoints:** (e.g., GET /api/models/:id) run SQL SELECT queries to fetch data.
- **Logic Endpoints:** (e.g., POST /api/book) perform a series of database operations:
 1. Find the selected car in Inventory.
 2. Create a new record in the Sale table.
 3. UPDATE the car's status in the Inventory table to "Booked" to remove it from stock.
- **Search Endpoints:** (e.g., GET /api/dealer/:id/inventory?search=...) dynamically build complex SQL queries using JOIN and LIKE to filter results across multiple tables based on user input.

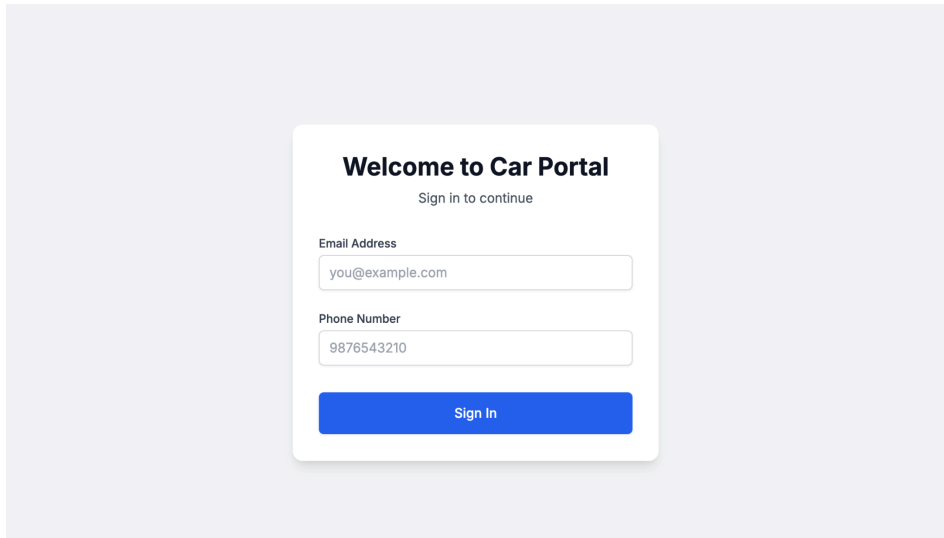

C. Frontend Implementation (index.html)

The frontend is a **Single-Page Application (SPA)**.

- **Dynamic Rendering:** Instead of reloading, JavaScript functions like renderModels() are used to generate HTML on the fly based on the JSON data received from the backend.
- **State Management:** A global currentUser object stores the logged-in user's data, which is then used to personalize the portal and auto-fill information during booking.
- **Asynchronous Calls:** The fetch() function is used to make asynchronous API calls to the backend, and a "Loading..." spinner is shown while the data is being retrieved. This ensures the user interface never freezes.

5. Project Output Screenshots

Screenshot 1: Login Page

A screenshot of a login page titled "Welcome to Car Portal". Below the title is the text "Sign in to continue". There are two input fields: "Email Address" with the value "you@example.com" and "Phone Number" with the value "9876543210". A blue "Sign In" button is at the bottom of the form.

Screenshot 2: Customer Portal - Car Model Selection

A screenshot of a customer portal titled "Customer Portal". It includes a "Sign Out" button in the top right corner. Below the title is a welcome message "Welcome, Aarav Sharma!". There are two links: "Book a Car" (underlined) and "Book a Test Drive". Below these links is a search bar with the text "Home". The main section is titled "1. Select a Manufacturer" and contains a grid of buttons for car manufacturers: Citroën, Hyundai, Jeep, Kia, MG, Mahindra, Maruti Suzuki, Nissan, Renault, Skoda, Tata, and Volkswagen.
